

Production adaptation for individuals with special needs

gevasol
Ping

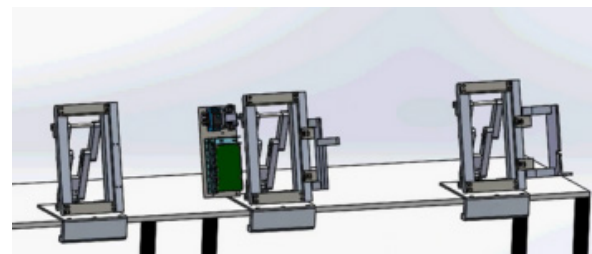

August | 2023

Gevasol production teams analyze processes and break them down into simple tasks, adjusting them for people with varying skill level.

Examples

- Neurodiverse individuals sometimes have strong preferences about performing a process in a specific order. If allowing freedom in the order of execution of a process doesn't affect its functionality, we accommodate.
- For workers with cognitive challenges, Gevasol engineers create tools that minimize errors, such as test jigs that leave no room for interpretation, templates, etc.
- For those with physical disabilities, we try to automate manual work processes. For instance, calibration of a product requires strenuous manual lifting and lowering of a handle. Motorizing this process enables physically challenged team members to operate the device.
